Method 2: Making Jam

Make My Strawberry Jam

Brought to you by the National Center for Home Food Processing and Preservation, University of Georgia Cooperative Extension and Clemson Cooperative Extension
The *PUT IT UP!* series of lessons in home food preservation includes six different food preservation methods: boiling water canning, making jam, pickling, freezing, drying, and pressure canning. Each method is divided into a beginning hands-on activity and an advanced hands-on activity. Activities may stand alone or be sequenced for cumulative learning. In addition to step-by-step procedures, reflection questions, and ideas for experimentation, each method also includes additional activities: a science-based fill-in-the blank challenge, a history-based word search, a glossary, a resource list, a knowledge test, and more.

On the following pages, *PUT IT UP! Make My Strawberry Jam* contains:

- **Beginning Activity:** Make My Strawberry Freezer Jam
- **Advanced Activity:** Make My Strawberry Jam with Regular Pectin
- **Additional Activities:** Make My Jam
Make My Strawberry Freezer Jam

Making Jam: A Preservation Exploration

How many times have you eaten a peanut butter and jelly sandwich? Maybe you prefer toast with jam? Have you tried thumbprint cookies, or maybe a crêpe filled with a yummy fruit spread? In this food science exploration, you’ll get to learn how to preserve your own jam at home.

Let’s start with some basics of food science and preservation:

**Preservation** means to prevent decay, or in other words to stop a food from breaking down and spoiling. Rotten tomatoes, moldy bread, and stinky old milk are all examples of spoiled foods.

Two very common preservation methods used in modern households to extend the shelf-life of foods are refrigeration and freezing. Other home food preservation methods include canning, pickling, drying, and making jam.

**Jam** gets its name from the action that makes it - jam is made when fruit and sugar are “jammed”, or mashed, together. The gooey, gel-like texture of jam comes from a balance of fruit and sugar along with acid and pectin.

Some fruits have enough natural acid and pectin to gel on their own once sugar is added, but other fruits need lemon juice and/or packaged pectin to be added. Most citrus fruits and apples have a lot of pectin in the white layer under their skin (called the rind or peel).

Freezer jam, as it sounds, is jam that is frozen so that you can use it for a longer time. Shelf-stable jam stored at room temperature is cooked then canned in a boiling water canner in order to be preserved.

Jam’s high acidity, large amount of sugar, and lack of available water slow the growth rate of microorganisms like mold, but freezing or boiling water canning is needed to fully stop spoilage.
Beginning Jam Making Activity: Strawberry Freezer Jam

Time required:
1 hour procedure + ½ hour additional freezing time
= 1½ hours

Ingredients:
For about 2 half-pint (8-ounce) jars
Multiply as needed, but only up to 6 half-pints at a time
- 1 quart strawberries (1-2/3 cups crushed) *
- 2/3 cup sugar
- 2 tablespoons Ball® Instant Pectin (1.75 ounces) *
- Any additional ingredients from ‘Want to Experiment?’ (optional)

Equipment needed:
- Refrigerator or freezer
- Half-pint (8-ounce) plastic freezer containers
- Labels and pens (optional)
- Permanent marker
- Soap
- Colander for washing strawberries
- Very sturdy drinking straws
- Small paring knife (s)
- Cutting board
- Baking pan or cookie sheet with raised edges
- Dish towel or slip-proof mat
- Potato masher
- Liquid and dry measuring cups
- Measuring spoons
- Large bowl
- Large spoon for stirring
- Kitchen timer
- Ladle
- Bubble freer or narrow spatula
- Headspace tool
- Spoon for adjusting headspace

* Options for other fruit and other pectin:

Strawberry jam is best made with fresh-picked, in-season berries. If you use store-bought berries, be sure to mash them up very well or you will get a lot of floating fruit and trapped air in the final product. If you choose other fresh-picked fruits (such as peaches, cherries, or other berries), then quantities may vary; follow the directions on pectin package labels or inserts.

This recipe is for use with Ball® Instant Pectin; there are other pectin products that can be used. If you use another brand, follow the recipe and directions that come with that pectin product.
Part One:
Preparing the Jars

1. Wash hands thoroughly with soap under running water for at least 20 seconds, rinse well, and dry.

2. Assemble equipment and ingredients.

3. Examine plastic freezer jars or freezer containers and discard any with cracks.

4. Wash plastic jars and plastic lids thoroughly in warm soapy water, rinse well.

5. Use a permanent marker to label lids with your name, the name of the product and the date.

The Procedure:
Just Follow These Steps...

Feeling creative?
Make up a company name for your products.

Fun Facts!
Strawberries are a member of the rose family.
The average strawberry has 200 seeds.

The average strawberry has 200 seeds.
Part Two: Preparing the Strawberries

6. Rinse strawberries in a colander immediately before using. Do not soak berries. Gently lift them out of water.

7. **Leader demonstration:** Basic knife skills. Grip the knife handle with dominant hand, wrapping fingertips behind knuckles for a tight grip. Slice with a rocking motion, not a chopping down action. Always pay attention and keep your fingers out of the path of the blade.

8. **☆** Remove the caps of the berries by holding a straw straight up against the tip of a strawberry and pushing the straw through the center of the berry until the leafy cap pushes off. Or, carefully use a knife to remove the tops of the berries.

9. **☆** Carve out and discard bruised spots with a paring knife if needed.

10. Thoroughly crush berries one layer at a time in a deep baking pan or cookie sheet using a potato masher. It is helpful to place a damp dish towel or slip proof mat under the pan to prevent sliding.

Fun Fact!

Jams have only about 48 calories per tablespoon and no fat.
Part Three:
Making the Jam

11. Measure and add sugar and instant pectin to a large bowl. Stir to mix.

12. Use liquid measuring cup to measure and add crushed strawberries to bowl.

13. Stir for 3 minutes. Ladle jam into clean freezer jars leaving ½-inch from the top of the juice to the top of the jar rim. This gap is called headspace. Measure headspace with ruler or headspace tool to ensure headspace is ½-inch.

14. Use bubble remover or spatula to release any large air pockets that are trapped in the jam. Check headspace and add or remove jam if needed.

15. Wipe jar rims with clean, damp paper towel. Anything on the rim might prevent the jar from closing properly.

16. Turn or press lids on freezer containers until tight.

17. Let jam stand 30 minutes.

18. Enjoy now, refrigerate for up to 3 weeks or freeze for up to 1 year.

Think About It:
Headspace

Have you ever seen what happens to the size of water after it freezes? As water freezes, each molecule of water expands, getting larger. There is so much water in fruits, and therefore in jams, that the same thing happens when jam freezes – it gets bigger!

If there is not enough space between the top of the jam and the lid, then as the jam freezes it may push against the lid and lift it, or push against the sides of the container so hard that it breaks. Air can also cause color and flavor changes in the jam (called oxidation), so too much headspace can lower quality.

Fun Facts from:

Fun Fact!

8 strawberries provide 140% of your recommended daily intake of Vitamin C.
Time to Reflect...

Write your responses to these questions. Then, share your reflections with someone else.

What was your favorite part of making strawberry jam?

________________________________________________________________________

For you, what was the most challenging part of making strawberry jam?

________________________________________________________________________

________________________________________________________________________

What surprised you most in this activity?

________________________________________________________________________

________________________________________________________________________

If you could do this activity again, what is one thing you would change? Why?

________________________________________________________________________

________________________________________________________________________

Do you think that making jam is a useful skill? Why or why not?

________________________________________________________________________

________________________________________________________________________

How will you use what you have learned about making jam?

________________________________________________________________________

________________________________________________________________________
Want to Experiment?

Use the jam as a topping for yogurt, ice cream, angel food cake, biscuits, croissants, toast, or English muffins.

Substitute equal amounts (1-2/3 cups) of crushed raspberries or blackberries or blueberries for the crushed strawberries to make freezer jam. Or combine these crushed fruits for a total of 1-2/3 cups. Do not increase the total amount of fruit or you will not have the proper proportions of ingredients.

Substitute 2/3 cup granulated Splenda® no-calorie sweetener for the 2/3 cup sugar.

Describe the flavor of your jam (sweet, tart, etc.). Compare the flavor, color, and texture of your jam with a store-bought jam. How do tastes, textures, and appearances differ? Do you prefer one more than the other? Why?

Evaluate the quality of your finished product. Use a scale of excellent to poor for the following categories: appropriate headspace, color, free of air pockets, clean seal, and labeling.

Did you really like making jam? Brainstorm, research, or just ask your leader about careers in which you get to play with food, like food science, cooking, or catering.

Making Jam: A Preservation Exploration

How many times have you eaten a peanut butter and jelly sandwich? Maybe you prefer toast with jam? Have you tried thumbprint cookies, or maybe a crêpe filled with a yummy fruit spread? In this food science exploration, you’ll get to learn how to preserve your own jam at home.

Let’s start with some basics of food science and preservation:

**Preservation** means to prevent decay, or in other words to stop a food from breaking down and spoiling. Rotten tomatoes, moldy bread, and stinky old milk are all examples of spoiled foods.

Two very common preservation methods used in modern households to extend the shelf-life of foods are refrigeration and freezing. Other home food preservation methods include canning, pickling, drying, and making jam.

**Jam** gets its name from the action that makes it — jam is made when fruit and sugar are “jammed”, or mashed, together. The gooey, gel-like texture of jam comes from a balance of fruit and sugar along with acid and pectin.

Some fruits have enough natural acid and pectin to gel on their own once sugar is added, but other fruits need lemon juice and/or packaged pectin to be added. Most citrus fruits and apples have a lot of pectin in the white layer under their skin (called the rind or peel).

Freezer jam, as it sounds, is jam that is frozen so that you can use it for a longer time. Shelf-stable jam stored at room temperature is cooked then canned in a boiling water canner in order to be preserved.

Jam’s high acidity, large amount of sugar, and lack of available water slow the growth rate of microorganisms like mold, but freezing or boiling water canning is needed to fully stop spoilage.

**Is it a Jam or a Jelly?**

Jam has pieces of crushed fruit, and jelly is made from fruit juice!
Advanced Jam Making Activity:
Strawberry Jam with Regular Pectin

Time required:
1 ½ hour procedure + ½ hour additional processing time
= 2 hours (+ 12 hour minimum cooling time)

Ingredients:
For about 8 half-pint jars

- 5 cups crushed strawberries (about 4 pints strawberries) *
- 1 package powdered pectin
- 7 cups sugar

Equipment needed:

- Gas or electric stovetop range with four burners
- Boiling water canner
- Half-pint canning jars
- Two-piece metal canning lids and ring bands
- Permanent marker, or labels and pens
- Medium saucepan for boiling water to be added to canner
- Large colander for washing strawberries
- Very sturdy drinking straws
- Small paring knife (s)
- Cutting board (s)
- Potato masher
- Baking pan or cookie sheet with raised edges
- Dish towel or slip-proof mat
- Liquid and dry measuring cups
- Large stockpot (6-8 quarts)
- Long-handled spoon and large ladle
- Slotted spoon
- Towel or cake-cooling rack
- Jar funnel and jar lifter
- Medium-sized bowl for pre-measuring sugar
- Headspace tool
- Spoon for adjusting headspace
- Paper towels
- Thermometer
- Kitchen timer (may be on oven)

* Options for other fruit and other pectin:

Strawberry jam is best made with fresh-picked, in-season berries. If you use store-bought berries, be sure to mash them up very well or you will get a lot of floating fruit and trapped air in the final product. If you choose other fresh-picked fruits (such as peaches, cherries, or other berries), then quantities may vary; follow the directions on pectin package labels or inserts.

This recipe is for use with regular powdered pectin. If you use a brand that provides a different recipe and directions, follow the recipe and directions that come with that pectin product.
The Procedure:
Just Follow These Steps...

Part One:
Preparing the Canner and Jars

1. Wash hands thoroughly with soap under running water for at least 20 seconds, rinse well, and dry.

2. Assemble equipment and ingredients.

3. Examine jars and discard any with cracks or chips. Examine ring bands and discard any with rust or bends.

4. Wash jars thoroughly in warm soapy water, rinse well.

5. ★ Fill the canner about half-full with hot water. Carefully use a jar lifter to lower jars right side up onto the rack in the canner in a single layer. If you are using 4 oz. jars and need to double-stack, then place a second canning rack on top of the first full layer of jars. Continue to place jars in a single layer on top of this second rack.

6. Turn burner on so that the water reaches and stays at 180°F. Leave jars in the canner in hot water until use.

7. Use a permanent marker to label lids with your name, the name of the product and the date. If using labels and pens, then wait until after processing, when jars have cooled.

8. Prepare two-piece lids according to the manufacturer’s instructions.

9. ★ Heat 3-4 cups hot water in a medium saucepan for adding to canner, if needed.

= Be Extra Careful!

Think About It:
Vacuum Seals
Vacuum seals form as jars cool, keeping air out of jars so that the food inside is less likely to spoil. Could a vacuum seal keep air out if there were cracks and chips in the jar?

Feeling creative?
Make up a company name for your products.

Fun Facts!
- The average strawberry has 200 seeds.
- Strawberries are a member of the rose family.

Adv.5
Part Two: Preparing the Strawberries

10. Rinse strawberries in a colander immediately before using. Do not soak berries. Gently lift them out of water.

**Leader demonstration**: Basic knife skills. Grip the knife handle with dominant hand, wrapping fingertips behind knuckles for a tight grip. Slice with a rocking motion, not a chopping down action. Always pay attention and keep your fingers out of the path of the blade.

11. ✴ Remove the caps of the berries by holding a straw straight up against the tip of a strawberry and pushing the straw through the center of the berry until the leafy cap pushes off. Or, carefully use a knife to remove the tops of the berries.

12. ✴ Carve out and discard bruised spots with a paring knife if needed.

13. Thoroughly crush berries one layer at a time in a deep baking pan or cookie sheet using a potato masher. It is helpful to place a damp dish towel or slip proof mat under the pan to prevent sliding.

Fun Facts!

Jams have about 48 calories and no fat per tablespoon.

8 strawberries provide 140% of your recommended daily intake of Vitamin C.
Part Three: Making the Jam

14. Pre-measure 7 c. sugar with dry cups into a bowl and set aside. Measure 5 c. crushed strawberries with liquid cups and add to stockpot.

15. Add package of regular pectin to strawberries and stir well. Turn burner under stockpot to high heat, stir constantly and bring to a full boil (bubbles over the entire surface).

16. Add 7 c. sugar, continue stirring, and heat again to a full bubbling boil. Boil hard for 1 minute, stirring constantly. Do not boil longer. Longer boiling may damage the pectin bond, causing jam to soften.

17. Remove from heat; quickly skim foam from top with a slotted spoon.

18. Remove jars from hot water with jar lifter, emptying any water back into the canner. Place jars upright on a towel-covered countertop or rack.

19. Rest funnel in jar opening and ladle jam into each jar leaving ¼-inch space from the top of the jam to the top of the jar rim. This gap is called headspace.

20. Check that headspace is ¼-inch; use a spoon to add or remove jam as needed.

21. Wipe jar rims with a damp paper towel. Apply lids according to manufacturer's directions. If using two-piece metal lids, turn bands onto jars until fingertip tight, or until you meet firm resistance using thumb and first two fingers to turn.

22. Use a thermometer to check that the water in the canner is 180°F for the hot pack. Adjust burner, if necessary.

Think About It: Why Fingertip Tight?

Why do you think it is important that lids are tightened just right?

Hint: If a band is too tight, could air escape? If a band is too loose, could liquid get out?
Making Jam

### What’s my Altitude?

Altitude is the elevation, or distance, above sea level. To find the altitude where you are, ask your leader or an Extension agent, visit a website about your town or city, or use the U.S. Geological Survey Geographic Names Information System (GNIS) online.

### Recommended Process Times for Strawberry Jam in a Boiling Water Canner

<table>
<thead>
<tr>
<th>Altitude</th>
<th>Process Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–1,000 ft.</td>
<td>10 minutes</td>
</tr>
<tr>
<td>1,001–6,000 ft.</td>
<td>10 minutes</td>
</tr>
<tr>
<td>Above 6,000 ft.</td>
<td>15 minutes</td>
</tr>
</tbody>
</table>

### Part Four: Boiling Water Processing

23. ⭐ Use jar lifter to place jars of jam one at a time in a single layer on the rack in the boiling water canner. Keep jars upright at all times. If more space is needed for 4 oz. jars, then place a rack on top of the lower layer of jars and stack a second single layer on that second rack. Make sure water is 1-2 inches above tops of jars. Add hot water from the saucepan if needed, pouring between jars rather than directly on top of jars.

24. ⭐ Place lid on canner and turn burner heat to high. Determine your altitude, and once the water comes to a boil, set timer using the time recommended on the table to the left. Maintain a gentle boil throughout the entire timing process.

25. ⭐ Once water has boiled continuously for the recommended time, turn off heat then remove the canner lid, lifting the underside of the lid away from you to direct the steam away from your face. Wait 5 minutes for contents to settle.

26. ⭐ Remove jars with jar lifter, being careful not to tilt them. Place at least 1 inch apart on a towel or rack. Place away from drafts of moving air.

27. Let jars cool, undisturbed, for 12 to 24 hours. If jars are taken home before cooling, keep in a refrigerator.

28. Check that each jar has a vacuum seal. Remove ring bands from sealed jars and wipe jars. Store in a cool, dark, dry place. Enjoy with family and friends within one year for best quality. Store unsealed and opened jars in the refrigerator.

### How to Test for a Vacuum Seal

- Feel for indent
- Listen for “ring”
- Look for concaveness

Listen for lids to “pop!” as the vacuum pulls them down.

### Table from:
National Center for Home Food Preservation [http://nchfp.uga.edu/how/can_07/strawberry_jam_powder.html](http://nchfp.uga.edu/how/can_07/strawberry_jam_powder.html).

### Fun Facts from:
Time to Reflect...

Write your responses to these questions. Then, share your reflections with someone else.

________________________________________________________________________

________________________________________________________________________

How will you use what you have learned about making jam?

________________________________________________________________________

________________________________________________________________________
Want to Experiment?

Use the jam as a topping for yogurt, ice cream, angel food cake, biscuits, croissants, toast, or English muffins.

Make thumbprint cookies!
Roll peanut butter cookie dough or sugar cookie dough into 1-inch balls, place on cookie sheet, make a small well with your thumb in the center of the ball and put ½ teaspoon of jam in the thumbprint before baking.

Describe and compare the flavor, color, and texture of your jam with a store-bought jam. How do tastes, textures, and appearances differ? Do you prefer one more than the other? Why?

Make jam with different fruits and/or different types of pectin (regular, freezer, low sugar, powdered, liquid). Follow recipes and directions on product packaging or in So Easy to Preserve.

Evaluate the quality of your finished product. Use a scale of excellent to poor for the following categories: appropriate headspace, color, bubble-free, clean seal, and labeling.

Did you really like making jam? Brainstorm, research, or just ask your leader about careers in which you get to play with food, like food science, cooking, or catering.

All About Jam

- FUNdamentals of Making Jam: A.A. 4
- Boiling Water Canner and Mason-Style Jar Anatomy: A.A. 5
- What’s the Story of Jam?: A.A. 6
- What Makes a Jam a “Jam”?: A.A. 7
- Glossary, Sources, and Resources: A.A. 8
- What Do You Know About Making Jam?: (A.A. 9)
Making jam is a science, so there are important facts and concepts at play. These FUNdamentals will help you understand the steps of the jam making procedure.

**FUNdamentals of Making Jam**

Use the word bank at the bottom of the page to correctly fill in the blanks. (Hint: The answers can be found in the pages of this activity book.)

__________________ is a method of food preservation that uses a low temperature to preserve foods for weeks, months, even up to a year.

_____________________________ is a method of food preservation that raises the temperature so high that spoilage microorganisms like molds and yeasts are destroyed.

Microorganisms (bacteria, mold, and yeast) sometimes cause food to __________. Low temperatures slow the growth of microorganisms; high enough temperatures kill them.

Microorganisms need ________________ to grow.

Water freezes into solid ice crystals. _________________________ cannot use frozen ice crystals to provide them with the water they need to grow.

__________________ is a substance that occurs naturally in fruits. A balanced ratio of pectin, water, sugar, and acid binds up water so that it is not available for microorganisms to use to grow.

__________, Cooperative Extension, and the National Center for Home Food Preservation have science-based recipes for making jam, like the recommendations in the books *So Easy to Preserve* and *Complete Guide to Home Canning*.

**Word bank:** PECTIN, USDA, FREEZING, MICROORGANISMS, SPOIL, BOILING WATER, CANNING, WATER
Boiling Water Canner Anatomy

Fill in each blank with the term to the right that describes that part of the canner.

A ______ can be used again and again until cracked or chipped.

________ on top of jar allow ring band to twist on tightly.

A ______ _____ secures lid to jar, and can be reused if not bent or rusty.

A _______________ has a springy center that dips down when pulled by a vacuum. After jars cool, gently rub the center of the lids with your fingertip; you have evidence that a vacuum has formed if you feel an indent.

_________ ____________ is a soft plastic in the bottom-edge groove of lids that softens when heated and forms an airtight seal around the lid when cooled.

---

Mason-Style Jar Anatomy

Use the labels in the illustration below to correctly fill in the blanks of the descriptions to the left.

---

AIRSPACE allows room for water to boil.

WATER must cover 1 to 2 inches above jars so that the jars will be completely surrounded by boiling water, even if a small amount evaporates.

LID/COVER of the canner prevents heat from escaping and reduces water loss from evaporation.

CANNER or STOCKPOT contains water so that it can heat to boiling.

RACK prevents jars from cracking due to high heat from the burner and allows water to circulate underneath the jars so that they are heated evenly on all sides.
Searching the puzzle for the 13 **UPPERCASE** underlined words from the history notes below and circle them!

- Ancient Greeks preserved fruit with honey. They mixed QUINCE (a fruit related to apples, pears and plums) with honey, partially dried the mixture, and packed it into jars. Ancient Romans cooked quince with honey to make a more jam-like product.

- The process of making jam with SUGAR began in Middle Eastern countries where sugar grew.

- Jams and jellies became popular in Europe in the Middle Ages, after Crusaders returned from countries in the **MIDDLE EAST**.

- In the U.S., early New England settlers preserved with molasses and maple syrup. They extracted PECTIN from apple peels and used it to thicken sweetened fruit mixtures into jellies.

- In the late 1890s, Jerome SMUCKER prepared apple butter and sold it in ceramic pots.

- In 1917, Paul Welch secured a patent for a grape jam product called "**GRAPELADE**." The U.S. Army purchased the entire product made by Welch for American troops in France during World War I. Troops returning after the war demanded more "Grapelade" so he began to produce it in mass quantity.

- The 1920s saw a major technological innovation in jam making — the widespread adoption of the **VACUUM** pan cooker for cooking jams and jellies under a vacuum. This was a significant step in improving jam quality because it allowed for boiling at a lower temperature.

- In 1940 the U.S. Food and Drug Administration (FDA) established Standards of Identity to legally define the labels "**JAM**", "**JELLY**", "**PRESERVES**" and "**FRUIT BUTTER**".

- The most popular **COMMERCIAL** jam in the U.S. is strawberry jam, although there are over 35 varieties of commonly produced jams and jellies, including some with more unique **INGREDIENTS**, like chocolate jam!
What Makes a Jam a “Jam”?

The answer is in the name: a jam is pieces of fruit and sugar “jammed” together. The texture of jam is thick and sticky. Similar but different, jellies are “jelled” fruit juice and sugar. The texture of jelly is firm enough to hold its shape, but still jiggles if moved. Preserves, conserves, and marmalades are other types of jellied fruit spreads. It takes the right balance of fruit or fruit juice, sugar, acid and pectin to form the gel in any jellied product.

Why Preserve Jam?

Have you heard about microorganisms? Sometimes called “germs”, they are tiny creatures that cannot be seen with human eyes unless aided by a microscope. Most microorganisms are helpful and even necessary for life, but some can spoil foods or even make us sick. The three types of microorganisms that spoil food most often are molds, yeasts and bacteria. You may have seen masses of mold as fuzzy spots on spoiled bread; pink shiny spots on spoiled cream cheese may be thousands of yeasts; slime on spoiled ground beef is caused by millions of bacteria.

Bacteria do not grow well in jams and jellies because they are made of acid foods (think of all those fruits that make your mouth pucker) and they contain a large amount of sugar. Bacteria may survive in acidic conditions (pH 4.6 or less) and without much water, but they cannot actually grow. Bacteria need water to grow, but the sugar in jams and jellies binds with water, making that water unavailable to bacteria so they cannot grow.

Molds and yeasts are the major cause of spoilage of jams and jellies. At room temperature, molds and yeasts are able to grow in acidic, high-sugar foods like jams and jellies. They typically grow at the top of jars, where oxygen contacts the food.

These microorganisms are killed by the high temperature of boiling, so spoilage of cooked jams and jellies can be prevented by the heat from a boiling water process. Cold temperatures do not kill mold or yeast like heat does, but cold does cause microorganisms to grow very slowly in the refrigerator (32°F to 40°F) and to grow little or not at all at freezer temperatures (0°F to -10°F). Jams made without boiling water canning rely on refrigeration to delay spoilage or on freezing to prevent it.
Glossary

**Acid** is a substance measuring below 7.0 on the pH scale; it tastes sharply sour.

**Acid foods** are foods with a pH value at or below 4.6; they taste sour.

**Bacteria** are a type of microorganism that grow on food and can cause spoilage or sickness.

**Boiling water canning** is the process of filling jars with food then covering the closed jars with boiling water for a long enough time to heat the product and destroy microorganisms.

**Food preservation** protects food from spoilage by microorganisms and enzymes.

**Microorganisms** are creatures so small they cannot be seen except with a microscope.

**Mold and Yeast** are types of microorganisms that grow on food and can cause spoilage.

**Oxidation** is chemical and physical changes caused by oxygen interacting with a substance.

**Pectin** is a natural complex sugar found in all fruits that helps give structure to plant cells.

**pH** is a measure of acidity, on a scale from 0 to 14.

**USDA** is the acronym for the United States Department of Agriculture; a reliable source for scientifically tested home food preservation recommendations, including making jam.

**Vacuum** is empty space created when air is pushed out of a container and is unable to re-enter.

What Do You Know About Making Jam?

If you think the statement is true then circle “True”, and if you think the statement is not true then circle “False”.

Jam making is based on science.  True  False
Freezing and canning are methods used to preserve jam for longer than just a few days. True  False
Refrigerating and freezing speed up the growth of microorganisms. True  False
Most microorganisms grow best in very acidic conditions. True  False
Without enough available water, microorganisms will not grow. True  False
All pectin is the same, so you can use any type of pectin in any recipe. True  False

If you agree with a statement below then circle “I agree”, and if you don’t agree with the statement then circle “I disagree”. There are no correct answers, just answer honestly with what is true for you.

I like to make my own snacks and other foods at home. I agree  I disagree
It’s fun to prepare and preserve food. I agree  I disagree
I know how to make jam (with the help of an adult). I agree  I disagree
I can get everything I need to make jam at home. I agree  I disagree
I will use jam recipes and instructions from USDA or other science-based sources. I agree  I disagree
Sometime when I am at home, I will try to make jam (with the help of an adult). I agree  I disagree
